

In the administrative console it is easy to get an overview and ensure that everything works as intended.

Wanova Mirage saves the clients

Are you having trouble taking care of all the laptops when the users are on the move? Wanova's product Mirage can make the IT department's job much easier. TechWorld is impressed and brings out the Top Class label.

Did you ever have a user calling you in a panic, saying that his laptop doesn't work correctly and that he needs to give an important presentation in half an hour? Do you sometimes need to move an installed computer to new hardware without problems? Do you sometimes need to access or restore files that you accidentally deleted, even if you are travelling and do not have contact with the domain? If so, Wanova's Mirage product is for you.

A 3 MB Agent

We install Mirage on a server where we previously added Microsoft SQL Server Express 2008 R2. Then we install a 3 MB Agent on a Windows 7 client, and after about ten minutes we are ready.

We start uploading our client to the server and when this is done, we remove some files that prevent Windows from working correctly. With a few clicks on the server side,

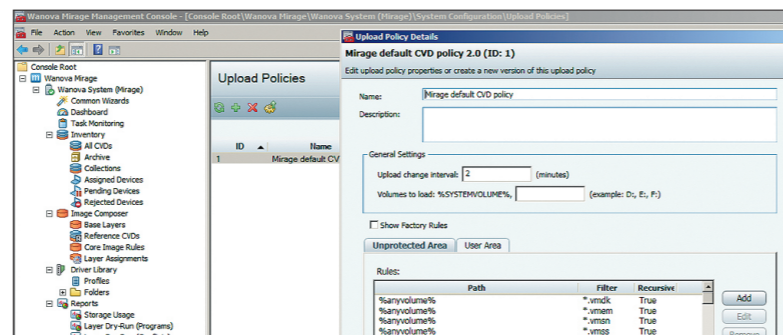

we order a restoration of the client and after a minute or two the client starts and has been restored to working order. Our local documents and self-installed programs will survive the operation. You can use Mirage to migrate the OS on a client from XP to Windows 7. Mirage then uses the Microsoft tool USMT to save as many of the user's settings and locally stored documents as possible, but locally installed programs are lost.

A migration or restoration of multiple clients does not need to mean that the traffic takes up all the bandwidth on the network. The transfer is compressed, and furthermore a designated client, called a reflector, is used on the local network, and the other clients can get their information from it, a feature resembling Microsoft's Branch Cache solution.

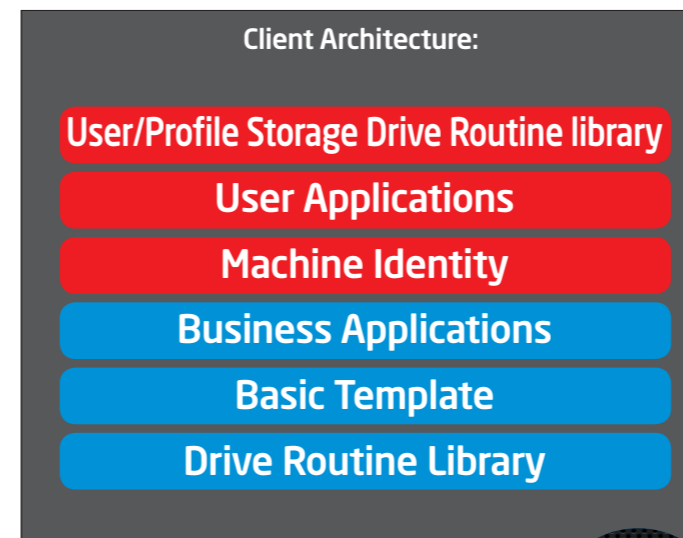

Built-in Wizards

We get a good overview that shows everything working correctly via a control panel, and built-in wizards make the product easy to use.

Mirage is a fairly complete client

You can choose which types of files and folders you want to include or exclude in the backup client.

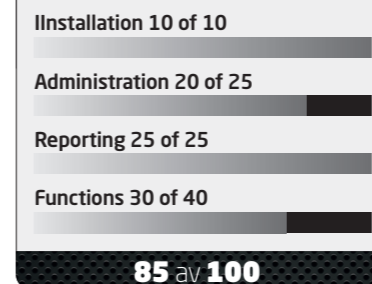

Mirage divides the client into different logical layers. The lower layer is managed by the IT department, the upper by the user. The upper layers will survive most of the operations we perform at the lower layers.
